Dear Hiring Manager,

I am a machine learning engineer at Capital One, where I build LLM agents and code-generation pipelines that take manual effort out of large data migrations. I am looking for a team where shipping measurable GenAI systems like these is the core of the work. I hold an M.S. in Computer Science from the University of Illinois Chicago.

For the Discover File System migration, I developed a human-in-the-loop Conversion Mapping Engine using the ReAct pattern. It proposes source-to-target mappings, critiques and refines them, and queries enterprise knowledge tools for data context before it decides. I ran the benchmark evaluations that compared models, reasoning settings and prompt versions, fed the results back into the agent's prompts and configuration, and the assistant reached 75% source-field recall on cross-domain benchmarks.

I also architected a GenAI ETL platform that translates natural-language mapping instructions into PySpark code deployable as AWS Glue jobs, pairing Llama 3.3-70B with retrieval, deterministic orchestration, automated code validation and feedback-driven retry loops. The platform reduced engineering effort by over 70% and cut delivery time from about 5 months to 4 weeks. I led the model benchmarking that chose its production model, comparing open models on latency, accuracy, hallucination rate and cost.

Before Capital One, I built document intelligence pipelines at Dockskiff to extract contract metadata, including a Prodigy auto-labeling pipeline that cut manual annotation effort by 60%.

I would welcome the chance to talk about how this experience could help your team ship reliable GenAI systems. Thank you for your time and consideration.

Sincerely,
Sunil Belde
